Attempt : 1

Total Mark : 40

Marks Obtained : 40

Section 1 : Coding

1. Problem Statement

John is tasked with configuring the lighting for a high-profile event, where different lighting modes affect the ambiance of the venue. He can choose from three distinct lighting modes, each requiring a specific adjustment to the initial light intensity:

Ambient Lighting (Mode 1): The intensity level is multiplied by 1.5.

Stage Lighting (Mode 2): The intensity level is multiplied by 2.0.

Spotlight (Mode 3): The intensity level is multiplied by 1.8.

In the event that an invalid mode is provided, the program should output an error message indicating the invalid selection.

Your task is to write a program that reads the selected lighting mode and the initial intensity level, applies the appropriate adjustment, and prints the

final intensity.

Input Format

The first line of input is an integer n, representing the lighting mode.

The second line is a floating value m, representing the initial intensity level of the light.

Output Format

The output displays "Intensity: " followed by a float representing the adjusted intensity level, formatted to two decimal places, if the mode is valid.

If the mode is invalid, the output should display "Invalid".

Refer to the sample output for formatting specifications.

Sample Test Case

Input: 1

10.0

Output: Intensity: 15.00

Answer

You are using Python

```
n=int(input())
```

```
m=float(input())
```

```
if(n==1):
```

```
    print(f"Intensity:{m*1.5:.2f}")
```

```
elif(n==2):
```

```
    print(f"Intensity:{m*2.0:.2f}")
```

```
elif(n==3):
```

```
    print(f"Intensity:{m*1.8:.2f}")
```

```
else:
```

```
    print("Invalid")
```

Status : Correct

Marks : 10/10

2. Problem Statement

Max is fascinated by prime numbers and the Fibonacci sequence. He wants to combine these two interests by creating a program that outputs the first n prime numbers within the Fibonacci sequence.

Your task is to help Max by writing a program that prints the first n prime numbers in the Fibonacci sequence using a while loop along with the break statement to achieve the desired functionality.

Input Format

The input consists of an integer n, representing the number of prime Fibonacci numbers to generate.

Output Format

The output displays space-separated first n prime numbers found in the Fibonacci sequence.

Refer to the sample output for the formatting specifications.

Sample Test Case

Input: 5

Output: 2 3 5 13 89

Answer

```
# You are using Python
n=int(input())
a,b=0,1
count=0
while(count<n):
    c=a+b
    a,b=b,c
    if(c>1):
        prime=True
        for i in range(2,int(c**0.5)+1):
            if c%i==0:
                prime=False
                break
        if prime:
```

```
print(c,end=" ")  
count+=1
```

Status : Correct

Marks : 10/10

3. Problem Statement

Taylor is tasked with a mathematical challenge that requires finding the smallest positive number divisible by all integers from 1 to n.

Help Taylor to determine the smallest positive number that is divisible by all integers from 1 to n. Make sure to employ the break statement to ensure efficiency in the program.

Input Format

The input consists of a single integer, n.

Output Format

The output displays the smallest positive number that is divisible by all integers from 1 to n.

Refer to the sample output for the formatting specifications.

Sample Test Case

Input: 10

Output: 2520

Answer

You are using Python

```
def gcd(a,b):  
    while b:  
        a,b=b,a%b  
    return a  
def lcm(a,b):  
    return (a*b)//gcd(a,b)  
n=int(input())
```

```
result=1
for i in range(1,n+1):
    result=lcm(result,i)
print(result)
```

Status : Correct

Marks : 10/10

4. Problem Statement

Nisha is a mathematics enthusiast, eager to explore the realm of twin prime numbers. The objective is to develop a program that enables the discovery and presentation of twin prime pairs.

The program should take an integer 'n' as input and generate 'n' pairs of twin primes, displaying the pairs with a difference of 2 between them.

Input Format

The input consists of a single integer, n.

Output Format

The output displays the 'n' pairs of twin primes, the pairs with a difference of 2 between them.

Refer to the sample output for the formatting specifications.

Sample Test Case

Input: 5

Output: 3 5

5 7

11 13

17 19

29 31

Answer

You are using Python

n=int(input())

count=0

num=3

l=[]

while count<n:

isnum=all(num%i!=0 for i in range(2,int(num**0.5)+1))

isnext=all((num+2)%i!=0 for i in range(2,int((num+2)**0.5)+1))

if isnum and isnext:

print(num,num+2)

count+=1

num+=2

Status : Correct
